RE: 09/692,077

Hi Paula:

The search results I received in this case did not include this portion of the search:

nucleotides 880-930 of SEQ ID NO: 1 nucleotides 880-930 of SEQ ID NO: 2

I really need this part of the search since the applicant's polymorphism is located in this region. Could you check to see if this portion of the search was simply not printed or not delivered?

Thanks - I appreciate your help.

Diana

Hello Paula -

Could you respond to this if possible? Any info would be appreciated (just trying to determine whether I can work on this one this biweek).

Thanks a lot.

FW: 09/692,077

If possible, could you give me an estimate re: when this search might be complete?

Thank you very much, Diana

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: This is a 'working draft' sequence. It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequencing vector: M13; M77815; 25% of reads Sequencing vector: Plasmid; n/a; 75% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.960731 Consensus quality: 215352 bases at least Q30 Consensus quality: 215747 bases at least Q30 Consensus quality: 215851 bases at least Q30 Consensus quality: 215851 bases at least Q30 Insert size: 215944; sum-of-contigs Quality coverage: 12.0 in Q20 bases; sum-of-contigs

Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the accession number will be preserved.

```

```
On Nov 9, 2002 this sequence version replaced gi:23268227.

The sequence in this assembly is a combination of BAC based reads (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig described individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that cone and there may be sequence genome shotgun sequence reads. Both ends sequences and whole table.

```

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank\_draft\_data.) NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it be preserved. clone end:Spb. On Nov 15, 2002 this sequence version replaced gi:22856702.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hggc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome spatials as the sequence contigs within a contig-scaffold that consist entirely of whole sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Submitted (21-FEB-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.h
NOTE: This is a 'working draft' sequence. It currently
consists of 4 contigs. The true order of the pleces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
soon as it is available and the accession number will
be preserved.

catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries which is clinically expressed as rinrametal's variant form or acute myocardial infarction (AMI). Alpha2B-AR gene is used in gene therapy The present sequence is a gene encoding human alpha2B-adrenoceptor (alpha2B-AR) protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 am the receptor polypeptide. Alpha2B-AR gene is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the carecholaminas normanizanhrina and minochrina a amino op of

                                                    Clone NGC-alpha2beta was isolated from a human spleen genomic library screening with a fragment of the human 5-HTIA receptor gene. The gene be used to express recombinant receptor protein which can be used to produce antibodies for inhibition of receptor function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the antihypertensive effect of compounds. The present sequence is human alpha

                                                                                                                                                        Query
                                                                                                                                                                                                                                                                      A genomic DNA clone (AAT59499) codes for human alpha-2B adrenergic receptor (AAW1804), a member of the rhodopsin-like signal transducer family. It was isolated from a human spleen genomic library in the lambda vector Charon 2B by screening with a 1.6 kb fragment of the human 5-hydroxytryptamine receptor gene. Plasmid pNGC-alpha-2B comprising DNA encoding the alpha-2B adrenoceptor is deposited as ATCC 68144. Vectors have been adapted to allow prodn. of alpha-2B adrenoceptor in bacterial, yeast or mammalian cells; transfected Ltk-cells, designated L-NGC-alpha-2B, are deposited as ATCC CRL 10275. Membranes of such cells can used in novel methods to identify drugs which specifically interact with, and bind to, the alpha-2B adrenergic receptor. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                 CC polynucleotide probes comprising a sequence selected from one of the 1490 CC sequences mentioned in the specification. The combination is useful as an acroarray for monitoring the expression of a number of conference of the polynucleotides. The microarray is useful as an CC diagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment of cancer and immunopathology and neuropathology. CC forenics and pharmacogenomics. The microarray is also useful for combination is also useful for the effects of currently available therapeutic drugs. The cc combination is also useful for profiles for the effects of currently available therapeutic drugs. The cc and genomic fragments and in research and diagnostic applications. The cc array can detect changes in expression in a large number of genes coding compathies e.g. AIDS and asthma, neuropathies e.g. Alzheimers disease. The present sequence represents a polynucleotide cc and parkinson's disease. The present sequence represents a polynucleotide cc format directly from USPNO at the printed specification but was obtained in electronic cc sequence.
                                                                                                                                                  Sequence 2072 BP, 316 A; 705 C; 660 G; 391 T; 0 U; 0 Other;

The present invention describes antigenic peptides (I) comprising: (a) CC any one of 1601 sequences (see ABPB2019 to ABBB3619) of 12-24 amino CC arids. Also described: (1) an assay for the detection of a particular GC and (2) an isolated antibody having high specificity and high affinity or an isolated antibody having high specificity and high affinity or antibodies. The particular GPCR. (I) can be used as GPCR modulators and in presence or absence of corresponding GPCRs and in the production of specific GPCRs and antibodies are useful for detecting an presence or absence of corresponding GPCRs. The antigenic peptides for CC GPCRs and antibodies are useful for detecting the treating immune-related disease, growth-related diseases, or autoimmune diseases, growth-related diseases, or autoimmune disease, e.g. AIDS, Alzheimer's diseases, call costeoarthritis, osteoporosis, cancer, cardiomyopathy, chronic and acute costeoarthritis, osteoporosis, cancer, cardiomyopathy, chronic and acute costeoarthritis osteoporosis, cancer, cardiomyopathy, chronic and acute consist, depression, schizophrenia, dementia, mental retardation, memory any other discreter in ABPA1861, dementia, mental retardation, memory can of discreter in ABPA1863 encode correction of the present invention which are used in the code correction of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Fig 1; 523pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             G protein-coupled receptor; GPCR; antigenic peptide; gene therapy; G protein-coupled receptor modulator; antibody; immune-related disease; growth-related disease; cell regeneration-related disease; AIDS; cancer; humunological-related cell proliferative disease; autoimmune disease; alteroscierosis; infection; osteoparthritis; allergy; osteoporosis; cardiomyopathy; inflammation; Crohn's disease; diabetes; graft versus host disease; parkinson's disease; multiple sclerosis; pain; psoriasis; anxiety; depression; schizophrenia; dementia; memory loss; mental retardation; epilepsy; asthma; tuberculosis; obesity; nausea; hypertension; hypotension; renal disorder; rheumatoid arthritis; trauma;

                                                                      밁
                                                                                         CC The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC sequences. (I) is useful as hybridisation probes, polymerase chain
CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC and in recombinant production of (II). The polynucleotides are also used
CC in diagnostics as expressed sequence tags for identifying expressed
CC genes. (I) is useful in gene therapy techniques for restore normal
CC useful for generating antibodies against it, detecting or quantitating a
CC useful for generating antibodies against it, detecting or quantitating a
CC useful for sexpressing (II). (I) and (II) are useful in medical imaging
CC supplement. (II) and its binding partners are useful in medical imaging
CC involving aberrant protein expression or biological activity. The
CC involving aberrant protein expression or biological activity. The
CC diagnostics, forensics, gene mapping, identification of mutations
CC responsible for genetic disorders or other traits to assess biodiversity
CC and to produce other types of data and products dependent on DNA and
CC coding sequences of the invention. Note: The sequence data for this
CC patent did not appear in the printed specification, but was obtained in
CC electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ

The proteins of the invention reduce and/or inactivate bone extension (i.e. development), with exception of the skull and have osteopathic activity. The nucleic acid molecules, proteins and antibodies can be used in diagnostic or pharmaceutical compounds e.g. for gene therapy. The methods and nucleic acid molecules, etc. are useful for production of transgenic animals, especially a transgenic mouse for the study of diseases associated with bone development, e.g. spondyloepiphysal dysplasia and achondroplasia. This sequence encodes the murine LOBO protein described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LOBO; long bones; bone development; bone extension; skull; osteopathic; diagnostic; pharmaceutical; gene therapy; transgenic animal; disease; spondyloepiphysal dysplasia; achondroplasia; murine; ds.

                                                                                                                                                                                                             20-NOV-2003
                                                                                                                                                                                                                                                  ADA66349 standard; DNA; 68230 BP.
                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel nucleic acids (I; designated LOBO (long bones)) encoding proteins influencing bone development in mammals. The proteins of the invention reduce and/or inactivate bone extension (i.e., the nucleic acid molecules, proteins and antibodies can be used in diagnostic or pharmaceutical compounds e.g. for gene therapy. The methods and nucleic acid molecules, etc. are useful for production of transgenic animals, especially a transgenic mouse for the study of diseases achondroplasia. This sequence encodes the murine LOBO protein described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                          Sequence 49999 BP; 13210 A; 11814 C; 10825 G; 14150 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 3; Page 69-97; 391pp;

CC A compound which modifies the expression of the CA genes or bind to gequences of the invention may enable the use of gene therapy or a useful for diagnosis and treatment of carcinomas-associated proteins (CAP) may have cytostatic activity and the carcinoma, breast cancer vaccine. Therefore the invention may be carcinoma, breast cancer and prostate cancer. The CA genes may also be the present sequence is that of the mouse Pp3CC gene may also be constructed as DNA vaccines and for generating animal models of carcinomas.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC The invention relates to recombinant carcinoma associated (CA) nucleic CC acid sequences from mouse and human (ADA01492-ADA03094), and to CC carcinobinant carcinoma associated proteins (CAP) encoded by them. The CC invention also encompasses expression vectors and host cells comprising a CC cA nucleic acid, a polypeptide (especially antibody) that specifically binds to the protein, and a biochip comprising CA nucleic acid or CC fragments thereof: The sequences of the invention were identified using CC oncogenic retroviruses, which insert into the genome of the host organism CC at random. Many of these do not carry transduced host oncogens or CC gathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host CC protococogenes. The CA nucleic acid sequences can be used to diagnose CC carcinoma (especially breast cancer, prostate cancer, lymphoma or CC leukaemia) or a propensity to carcinoma by determination of the sequence CC fisuses. (A nucleic acids, proteins and antibodies are also useful as therapeutic agents and in screening and evaluating drug candidates. The CC present sequence represents a specifically claimed murine CA nucleic acid sequence of the invention. Note: The complete sequence data for this cathography from WIPO at the sequence data for this cathography is the form will an electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                          in the specification. A polymucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a mouse gene of the invention.

Novel Nogo receptor homolog polypeptide, NgR2 or NgR3, useful for treating central nervous system disorder, cerebral injury, spinal treating stroke, and demyelinating diseases. cord

Example .16; Page 219-275; 277pp; English

The invention relates to a Nogo receptor homologue polypeptide, NgR3, RgR3, comprising a 50 amino acid LRRCT sequence, a 284 amino acid acid NRRCT sequence, or a 420, 461 or 392 amino acid sequence, all given in the specification. The NgR3 protein or its binding antibody is useful for decreasing inhibition of axonal growth of a central nervous system () system (CNS) ö NTLRRCT

CC This invention describes a novel nucleic acid representing a synthetic CC Reax gene. The Bax gene of the invention is useful for identifying Bax-cc candida spp. sequences that are differentially expressed in a pathway CC inhibitor sequences of Bax-induced cell death or identifying inhibitors or control activity and can be used in vaccines or for gene therapy. The CC invention have cytostatic, fungicide; immunosupressive, virucide and CC isolated nucleic acids, polypeptides, pharmaceutical compositions, CC antisense molecules and antibodies are useful as medicaments or in CC diseases associated with yeast or fungi or proliferative disorders, such CC or polypeptides, or the genetically modified organism are useful for CC as cancer, or for preventing apoptosis in certain diseases. The compounds CC preparing a medicament for modifying the endogenic flora of humans and CC preparing a medicament for modifying the endogenic flora of humans and content of the compounds of the compounds of the compounds of the content is useful for immunising against yeast or content mammals. The vaccine is useful for immunising against yeast or fings infections or neurodegenerations. The content of the invention of the save gene content of the disclosure of the invention or neurodegenerations.
